2021 KANSAS SOYBEAN PERFORMANCE TESTS

STATEWIDE GROWING CONDITIONS

The 2021 soybean season had a varied but overall favorable weather pattern for the state, but was not without production challenges.

The primary challenge to the soybean crop in 2021 was saturated and over-saturated soils at the start of the growing season. In May, 97% of the state had adequate or surplus subsoil moisture, which delayed planting, slowed emergence, and caused poor stand uniformity. Soybeans can survive if submerged for less than 48 hours, or up to seven days if the temperature is below 80°F. This was often not the case, particularly in southeast Kansas, and many soybean fields in that area had to be replanted.

Wet soils are also susceptible to sidewall compaction and surface crusting when the soil is too wet at planting followed by dry periods, which were frequent issues in Kansas as the weather turned warmer and drier in June.

Dry conditions continued through July and August, and many soybean fields struggled with stress and nutrient deficiencies brought on by the wet start that hindered root and nodule development. Precipitation picked up again for many parts of the state in September and October, but was often too late to have a positive effect on grain fill. Consequently, soybean yield and quality varied across the state, but overall 2021 was a decent year for soybeans in Kansas.

DISEASES

In 2021, soybean disease reports were comparable to previous years. In general, very little frogeye leaf spot was reported. In northeast Kansas, sudden death syndrome was observed, but overall prevalence was low.

Charcoal rot was severe in some locations, particularly in the central part of the state and was likely due to dry weather during June and July.

Phytophthora root rot was present in eastern Kansas. This disease has been increasing in importance in recent years, particularly in soils with high clay content and poor drainage.

White mold, stem canker, pod and stem blight, and Septoria brown spot were occasionally present, but rarely at yield limiting levels. (Rodrigo Borba Onofre, Department of Plant Pathology)

INSECTS

Soybean defoliators were much less visible across the state in 2021 than in the past 3 years. Very few reports of green cloverworms or thistle caterpillars were noted in 2021 and these were the two main defoliators over the past 3 years. Bean leaf beetle populations were also considerably reduced in 2021.

However, a newer defoliator became much more problematic in 2021- Japanese beetles. These relatively large beetles have been quite common in the eastern quadrant of Kansas but have been slowly eating their way west in the state. In 2021, they caused considerable defoliation and thus considerable concern in several counties west of Interstate 35. This Japanese beetle infestation needs to be closely monitored in 2022 as these populations seem to be increasing faster than expected. (Jeff Whitworth, Department of Entomology)

TEST OBJECTIVES AND PROCEDURES

Soybean performance tests are conducted each year to provide information on the relative performance of new and established varieties and brands at several locations in Kansas.

Seeds for tests are from private seed companies, certified growers, and agricultural experiment stations (Table 1). Seed quality, including factors such as purity and germination, can be important in determining the performance of a variety. Soybean seed used for private and public entries in the Kansas Crop Performance Tests is prepared professionally and usually meets or exceeds Kansas Crop Improvement Certification standards. Relative performance of a given variety comparable to that obtained in these tests is best assured under similar environmental conditions and cultural practices and with the use of certified or professionally prepared seed. All companies known to be developing and marketing soybean varieties or brands are invited to submit test seed; interested companies enter on a voluntary, fee-entry basis.

Entries were planted in four-row plots with rows 30 inches apart and were replicated three or four times each. Seeding rate ranged from 7 to 12 seeds per foot of row. The center two rows of each plot were harvested for yield. Harvested row lengths ranged from 11 to 33 feet, depending on location. Cultural practices and rainfall for each test location are presented with each table. Results from this year's tests

are presented in Tables 2 through 15. Relative yields of each entry from all locations are shown in Table 16.

DATA INTERPRETATION

Yields are recorded as bushels per acre (60 lb/bushel) adjusted to 13% moisture content, when moisture data are available. Seed yield also is expressed as a percentage of the test average to assist in identifying entries that consistently produce better than the average yield.

Maturity is the date on which 95% of the pods have ripened (browned). Delayed leaf drop and green stems are not considered when assigning maturity. About 1 week of good drying weather after maturing is needed before soybeans are ready to harvest.

Lodging is rated at maturity by the following scores:

1. Almost all plants erect
2. All plants slightly leaning or a few plants down
3. All plants leaning moderately (45%) or 25 to 50% of plants down
4. All plants leaning considerably or 50 to 80% plants down
5. Almost all plants down

Height is the average length from the soil surface to the top of the main stem of mature plants.

VARIETY OR BRAND SELECTION

Performance of soybean varieties or brands varies from year to year and from location to location, depending on factors such as weather, management practices, and variety adaptation. When selecting varieties or brands, producers should carefully analyze variety performance for two or more years across locations. Performance averaged over several environments will provide a better estimate of genetic potential and stability than performance based on a few environments.

Small differences in yield between any two varieties or brands usually are not important. Within maturity groups at each location, a LSD (least significant difference) was calculated. The significance level used to calculate the LSD was 10%. Unless two varieties differ in yield by more than the LSD, genetic yield potential of one entry cannot be considered superior to that of another.

The coefficient of variability (CV) represents an estimate of the precision in the replicated yield trials. A CV of less than 10% indicates a good test with a high level of reliability. CVs ranging from 10 to 15% are usually acceptable for performance comparisons. CVs greater than 15% generally lack sufficient precision to provide any more than a rough guide to cultivar performance. For tests in which the precision was insufficient to statistically compare performance among the entries, the LSD value has been replaced with the designation NS, indicating that seed yields were not significantly different.

Test results also can be found online at:

Dale Roberds Farm, Pittsburg, Cherokee County; Bill Schapaugh, agronomist

Parsons Silt Loam

The planting conditions were typical double crop conditions with very heavy standing wheat stubble. Planted into harvest tracks which created a variable stand. The moisture conditions were at the saturation point which created some hairpinning of the heavy residue. Early in the growing season we observed some deer feeding on the plot. The plot had ample moisture throughout the growing season.

Rainfall:	April	May	June	July	Aug.	Sept.	Total
	2.8	4.7	8.3	4.6	2.4	2.8	31.9

Planted 7/8/2021 at 155,000 seeds/ft; harvested 11/9/2021; 24 ft. by 4-row plot; pesticides: 7/3/21 Trivence 6 oz/a; Paraquat 32 oz/a; 9/28/21 Select 12 oz/a spot application

North Central Kansas Experiment Field, Belleville, Republic County; Scott Dooley, agronomist

Crete silt loam

Rainfall:	April	May	June	July	Aug.	Sept.	Total
	1.5	3.5	0.5	4.8	5.7	2.1	20.3

Good planting conditions in May. Heavy Bean Leaf Beetle feeding in late May and early June, but no impact to final yield. Overall excellent yields considering the dry conditions in June and early July. Observed a small amount of shattering and lodging. Dicamba damage noted in the middle of the season. The late maturity check plots were not harvested at this location as they were still green.

Planted at 142,000 seeds/ft²; harvested 10/20/2021; 23 ft. by 4-row plot; pesticides: 5/7/21: 1.5 qt/a Makaze, 3.75 oz/a Fierce; 6/15/21: 16 oz/a Intensity One

Clayton Short Farm, Assaria, Saline County; Bill Schapaugh, agronomist

Ladysmith silty clay loam

Dry conditions at planting with a hard crust which required a deeper planting depth. Limited residue at planting from a light cover crop. The crop struggled with moisture and heat stress for most of June and July. Some rain in August gave stress relief and allowed the soybeans to complete seed fill.

	April	May	June	July	Aug.	Sept.	Total
Rainfall:	3.4	5.3	2.0	1.8	4.3	3.0	21.8

Planted 6/14/2021 at 155000 seeds/ft²; harvested 10/16/2021; 12 ft. by 4-row plot; pesticides: 5/25/2021 Paraquat 32 oz/a; Warrant 48 oz/a; 6/5/2021 Round up 32 oz/a; Authority Supreme 10 oz/a

Excerpts from the University Research Policy Agreement with Cooperating Seed Companies

Permission is hereby given to Kansas State University (KSU) to test varieties and/or hybrids designated on the attached entry forms in the manner indicated in the test announcements. I certify that seed submitted for testing is a true sample of the seed being offered for sale.

I understand that all results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University so as to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety provided the source is referenced and data are not manipulated or reinterpreted; 2) Advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 1167, '2021 Kansas Performance Tests with Soybean Varieties,' or the Kansas Crop Performance Test website, www.agronomy.k-state.edu/services/crop-performance-tests/index.html, for details."
